Development of parasequences

Deposits accumulate through time in progressively shallower-water depths

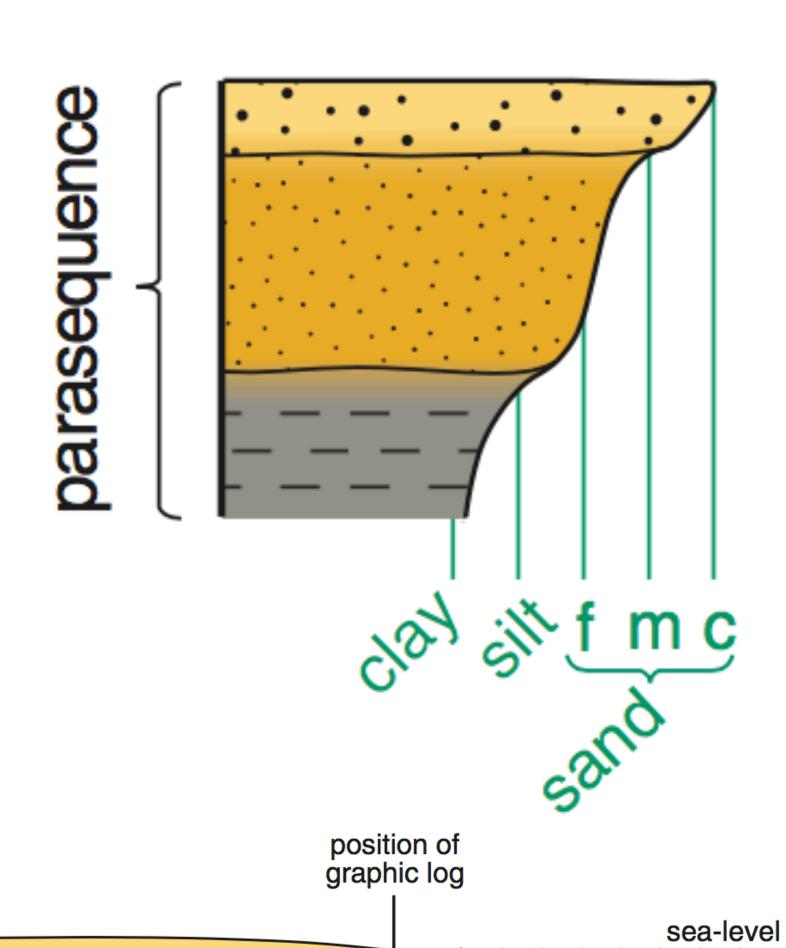

parasequence is shallowing-upward and usually coarsening-upward

If rate of sed. supply & rate of acc. space remained constant: the succession continues to prograde into the basin until the sediments have filled all the available accommodation space.

Development of parasequences

relative sea-level rise

What will happen if there is an increase in the rate of creation of acc. space (i.e. a relative sea-level rise) such that it is greater than the rate of sed. supply?
